

Xenotarsosaurus ("strange-ankle lizard") is a little-understood theropod of the late Cretaceous (~83 - 73 mya). It probably weighed 0.7 - 1.0 tons.

The only fossil evidence consists of a small number of vertebrae and leg bones, retrieved from the Bajo Barreal Formation, Chubut, Argentina. From these samples, Martinez, Giminez, Rodriguez and Bochaty named the type species, X. bonapartei, in 1986. It was probably an allosaurid.
